

Policy pricing and municipal tax calculation is a challenge when the policy has inaccurate or missing address information. In addition, state tax jurisdiction assignment requires a level of accuracy to meet underwriting and audit requirements. Introducing **PosiTax**.

ON DEMAND

ETM's **PosiTax** risk location software is compliant with the [KRS 91A.0806\(6\)](#) and [Kentucky HB 524 insurance premium tax requirements](#). You can use **PosiTax** to collect information on all your municipal taxes, state fees, state contacts, filing due dates, and taxing jurisdiction FIPS coding. Flexible deployment options allow organizations to access geocoding information through a web browser, Microsoft Excel or even integrate the data into their policy or underwriting systems via an API.

RESULTS

PosiTax delivers tax codes, fee information, and rate information quickly and accurately via a single address lookup or batch-process. Jurisdiction data returns ready to import into source systems for processing. Using Microsoft Excel and the add-in tool, users can look up addresses within municipal tax states to determine individual liabilities and applicable regulations.

PRECISE

PosiTax uses geocoding databases (municipal boundaries, police and fire districts, state-defined geographies, latitude, and longitude) to find precise locations to assign taxing jurisdictions, and (where applicable) to find municipal- and county-level rates by line of business. This means the correct municipal tax jurisdiction is assigned and the correct municipal tax due to the municipalities is calculated based on exact municipal tax district requirements.

SENSIBLE

With **PosiTax**, jurisdiction information is updated quarterly with the latest annexation and tax law changes. This assures you are working with the most current and accurate data. Because **PosiTax** is available from the cloud, there is no infrastructure cost and no software updates. Operating costs and noncompliance penalties are reduced because you continually have the latest data to process.

With **PosiTax**, policy pricing and tax jurisdiction determination is simply and sensibly better.
